VTT Develops new Reverberation Chamber
Flexible / Lightweight / Portable / Easy to Use

[PALMYRA, NEW YORK, May 1 2019-]V Technical Textiles is proud to announce the development of a Reverberation Chamber, which is used to create a diffused RF field with a uniform distribution of RF energy and random direction of RF noise. It is a mode-stirred chamber used by Defense, Aerospace, and Automotive sectors for: RF noise control and emission testing, RF isolation, RF absorption testing, and transmission loss testing. The flexible design of the V Technical Textiles reverberation tent allows the user easy change of source configuration/placement and uses lightweight fabric diffusers, which allow for less stirrer motor noise for maximum space efficiency and ease of use.
